

E-DISTRIBUTION

PALLET RACK SYSTEMS

E-Distribution designs and manufactures an extensive variety of structural and roll-formed racking systems, each providing a unique solution for a range of applications and storage needs. An efficient multiple SKU warehouse integrates several of these racking mediums to achieve optimal capacity and order throughput. E-Distribution will analyze your inventory data, looking at on hand inventory and order processing requirements to select the right rack type for each item stored.

Selective Storage Rack

Selective rack is the most common type of pallet racking, providing 100% accessibility for all pallet locations at the aisle face. All bays are either 1-pallet deep or back-to-back rows with 2- pallets deep. Selective rack has a distinct space disadvantage since every pallet location must have an accessible aisle for pallet loading and unloading. Most warehouses start with single selective pallet rack and add drive-in or push-back racking after the building is full.

Drive-In Rack

Drive-In is a high density storage system providing up to 10 pallets or more in depth. Items stored in Drive-In should be large quantities of pallets of like items - An ideal Drive-In requirement has a total pallet count of at least 4 full bays x the depth of each bay in order to get proper rotation of the product. Drive-In provides similar storage density to bulk floor stack storage without the risk of product damage since products are not stacked on the floor.

Push-Back Rack

Push-Back combines the high density of Drive-In Rack with the selectivity of Selective Rack. Each pallet face can store a unique SKU on rolling carts which are gently push-backed by the forklift on a slightly inclined track, providing up to 2-6 pallets deep. All carts flow forward to the aisle face providing easy accessibility with greater density. Items stored should require at the least 4 lanes x push-back depth in order to get proper rotation. Push-back is more expensive but allows storage and retrieval with a standard forklift and can save on construction costs.

E-Distribution will help you properly apply a variety of rack types for your inventory requirements to maximize space before a building expansion is needed.
